I have a column "group" that holds a user's group affiliation. I want to create a new column "sex" that has a value of "f" if the value of "group" is "male" and "m" if "group" is "female". I can do this with the code below, but it seems like there should be a cleaner way to do this that does not require the conditional. `df["sex"] = np.where(df["group"] == "male", "f", "m")` A: You can use `numpy.select`. Something like this should work. `df['sex'] = np.select([df['group'].eq('female'), df['group'].eq('male')], ['f','m'], default='m')` A: I'd also strongly advise against changing column values without a reason, but in case you still want it, here is a little bit of a hack. In [26]: `df.loc[df['group']=='female','sex'] = 'f'` In [27]: `df.loc[df['group']=='male','sex'] = 'm'` In [28]: `df Out[28]: group sex 0 male m 1 female a1d647c40b`
